                                                                                                                                                  The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env. Gag. Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag. Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449 ABK91624 represent modified HIV protein-encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3497

New modified human immunodeficiency virus Env, Gag, Pol of Nef DNA and its encoded protein, useful as vaccines for genetic or protein immunisation for acquired immunodeficiency syndrome or human immunodeficiency virus infection -

Disclosure; Page 739-741; 794pp; English.

The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env. Gag. Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.

(human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env. Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding
                                                                                                                                                             The invention relates to a nucleic acid molecule encoding a modified HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3143
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3257

New modified human immunodeficiency virus Env, Gag, Pol of Nef I its encoded protein, useful as vaccines for genetic or protein immunisation for acquired immunodeficiency syndrome or human immunodeficiency virus infection

and

DNA

Disclosure; Page 760-763; 794pp; English.

The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env. Gay, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gay, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
